Source track
+ source adapter
Album variant
Artist variant
Confidence thresholds are centralised in one shared constants module
Active adapter set (enabled and credentialed)
Strategies in order: UPC lookup, ISRC inference (sample the tracklist and vote on album name), text search
Name-similarity confidence formula with bonuses for exact match and prefix-stripped equivalence
Exclude the source adapter from the target list
For each remaining adapter: run in parallel with timeout
first preference
all settled
Strategy 1: lookup by ISRC (when adapter supports it and track has an ISRC)
Filter low-confidence matches (except synthetic search fallbacks)
no ISRC match
Strategy 2: text search by title and artist
Derive YouTube Music link (same channel / video id on a sister hostname)
Synthetic search-fallback link when no direct video match
Sort by confidence
Resolved cross-service links
